

Business Requirements & Functional Overview

Version: 1.0

1. Project Overview

The objective of this project is to build an independent Liquidity Provider (LP) platform that enables Forex/CFD brokers to integrate with a single liquidity infrastructure without managing their own execution backend.

The platform acts as the central liquidity gateway between brokers and the execution infrastructure.

Brokers will integrate only with our LP platform through APIs. The underlying execution infrastructure remains completely hidden from brokers.

This platform is designed exclusively for B2B clients (Forex/CFD Brokers) and is not intended for retail traders.

2. Business Model

The platform operates as a B2B Liquidity Provider.

Business Flow:

Retail Trader

↓

Broker Platform

↓

Independent LP Platform

↓

Execution Infrastructure

↓

Liquidity Source

Retail traders never interact directly with the LP platform.

The broker remains the only entity responsible for client onboarding, client management, and client-facing trading services.

The LP platform only provides liquidity, execution, reporting, and risk services to brokers.

3. Broker Registration & Onboarding

Any broker should be able to register through the platform.

Registration includes:

- Company Information
- Business Contact Details
- KYC Documentation
- Business Verification
- Agreement Acceptance

After successful verification, the Super Admin approves the broker account.

Once approved, the broker receives:

- API Access
- API Credentials
- WebSocket Access
- API Documentation
- Wallet
- Trading Credit
- Broker Dashboard Access

4. Wallet & Credit System

Every broker has an individual wallet.

Supported deposit methods include:

- USDT
- BTC
- ETH
- USDC

Deposits are converted into available trading credit.

The platform continuously maintains:

- Wallet Balance

- Credit Limit
- Used Credit
- Available Credit
- Margin Usage
- Trading Exposure

Trading availability depends on the broker's available credit.

5. Broker Integration

The broker integrates its own CRM, trading platform, or back-office system with the LP platform using REST APIs and WebSocket APIs.

All client orders are submitted to the LP platform.

The broker never communicates directly with the execution infrastructure.

The LP platform acts as the broker's only trading gateway.

6. Market Data

The LP platform continuously streams real-time market prices.

Brokers may display these prices to their clients.

Brokers are not permitted to publish their own market data into the LP platform.

However, during order placement, if enabled by the Super Admin, the broker may submit an execution price together with the order request.

This execution price is used only for order validation and execution purposes.

It is not treated as a market data feed.

7. Execution Price Validation

Execution Price Validation is an optional feature controlled by the Super Admin.

When enabled, the broker may include an execution price with the order.

Before execution, the LP platform validates:

- Symbol
- Execution Price

- Price Freshness
- Allowed Price Deviation
- Order Volume
- Trading Session

If validation succeeds:

The submitted execution price is accepted.

If validation fails:

The platform follows the configured execution policy, which may include:

- Rejecting the order
- Executing using the LP market price

This prevents stale, manipulated, or invalid pricing.

8. Order Execution

Each broker is assigned one dedicated execution account.

This assignment is performed manually by the Super Admin.

Every order submitted by the broker is always executed through the broker's assigned execution account.

The broker has no visibility into:

- Execution Account
- Execution Infrastructure
- Liquidity Connections
- Internal Trading Systems

The broker only receives the final execution result.

9. Pricing Model

The platform follows a Cost + Markup business model.

LP Platform provides:

- Raw Spread
- Raw Commission
- Raw Swap

Broker configures:

- Spread Markup
- Client Commission
- Pricing Profiles

The final trading conditions presented to the broker's clients are generated from these configurations.

10. Revenue Model

Platform revenue is generated from the pricing difference between LP costs and broker pricing.

Example:

LP Raw Commission

↓

Broker Commission

↓

Broker Profit

Similarly:

LP Raw Spread

↓

Broker Spread Markup

↓

Final Client Spread

↓

Broker Revenue

The platform does not pay rebates to brokers under this business model.

Each broker is responsible for determining its own client pricing strategy within platform-defined limits.

11. Client Data Management

The LP platform stores individual client trading information internally.

This enables:

- Accurate Position Tracking
- Floating PnL Calculation
- Closed PnL Calculation
- Exposure Monitoring
- Trade History
- Reporting
- Risk Analysis

Every client belongs exclusively to one broker.

Data isolation is mandatory.

Broker A cannot access Broker B's clients under any circumstances.

The Super Admin has complete visibility across all brokers.

12. Broker Dashboard

The Broker Dashboard provides business-related information only.

Available features include:

- Wallet
- Credit Usage
- Client Accounts
- Client Positions
- Floating PnL
- Closed PnL
- Open Orders
- Trade History
- Reports
- API Credentials
- API Documentation
- Pricing Settings
- Deposit History
- Withdrawal Requests
- Notifications

The Broker Dashboard must never expose internal infrastructure.

The following information remains hidden:

- Execution Accounts
- Internal Trading Systems
- Liquidity Providers

- Internal Order Mapping
- Internal Execution Details

13. Super Admin Dashboard

The Super Admin controls the entire platform.

Responsibilities include:

- Broker Approval
- Broker Suspension
- Wallet Management
- Credit Allocation
- Deposit Approval
- Withdrawal Approval
- Execution Account Assignment
- Market Configuration
- Symbol Management
- Pricing Management
- Platform Monitoring
- Risk Monitoring
- Client Monitoring
- Reporting
- Audit Review

Only the Super Admin has access to execution infrastructure details.

14. Pricing Control

Pricing responsibilities are divided between the LP Platform and Brokers.

Super Admin controls:

- Raw Spread
- Raw Commission
- Raw Swap
- Trading Symbols
- Trading Rules
- Maximum Pricing Limits

Broker controls:

- Spread Markup
- Client Commission

- Client Pricing Profiles

The broker cannot modify any LP base pricing.

15. Core Business Rules

The following business rules govern the platform:

- Every broker operates independently.
- Every broker has an individual wallet.
- Every broker has an individual trading credit.
- Every broker is assigned one dedicated execution account.
- Brokers cannot view or access execution infrastructure.
- Brokers cannot access other brokers' data.
- Client information is isolated per broker.
- Super Admin controls all base pricing.
- Brokers may only configure markup and commission within permitted limits.
- Every trade must be recorded for reporting and auditing purposes.
- All balances, positions, and PnL values are updated in real time.
